

New York Congressional District 10

REPRESENTED BY

U.S. Representative **Daniel S. Goldman** (D)

DISTRICT FACT SHEET

Estimated people with a vehicle commute crossing the zone boundary

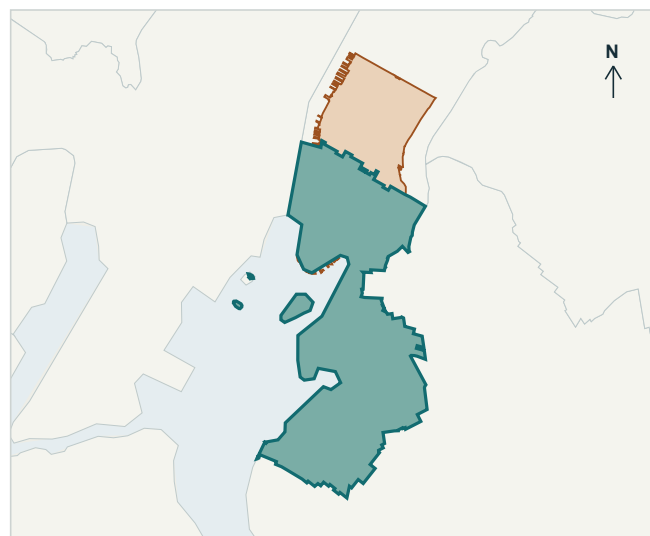

9,610

2.5% of all resident workers

For comparison, **59.3%** of this district's commuters already use transit — for any job, not only ones in the zone.

383,570 resident workers

Counts people, including carpool passengers — not toll-paying vehicles.

■ District ■ Endpoint study zone

TO A JOB IN THE ZONE

2,890

RETURNING HOME TO THE ZONE

6,720

LOCATION SENSITIVITY

8,750–11,270 people

Range for unresolved workplace locations and split destination tracts.

This is not a confidence interval; residence allocation is held fixed.

Located-workplace subtotal: 8,790 ± 2,480 people (approximate 90% margin of error). The subtotal uses more precisely located flows; the headline also models missing Manhattan workplace tracts.

127,320

Transit commuters to jobs inside the zone

5,740

Taxicab commuters with a home or job inside the zone

Transit use is context, not an individual benefit estimate. Taxicabs are shown separately because eligible taxis and for-hire vehicles face a per-trip charge.

How to read this estimate

New York Congressional District 10

Workers age 16 and over, including work from home	383,570
Workers traveling away from home	317,290
Vehicle exposure / workers traveling away from home	3.0%
Manhattan auto workers with workplace-tract locations	79.6%
District population within the 31-county study region	100.0%

DISTRICT INTERPRETATION

Most modeled vehicle exposure in this district comes from residents returning home to the zone after working elsewhere. A commute made wholly within the zone does not, by itself, incur an entry toll.

WORKPLACE MODEL

CTPP 2017–2021 flows supply the worker counts. Census block populations allocate residence tracts to districts. LODES 2021 primary jobs allocate split destination tracts. Missing Manhattan workplace tracts are assigned the zone share of located flows for the same home tract and mode group, with a regional fallback where needed.

UNCERTAINTY

The location range varies unresolved workplaces and split destination tracts. The separate located-subtotal margin combines weighted source margins under a zero-covariance approximation. Neither captures all allocation error or changes since 2021. Small estimates, especially where the margin is larger than the subtotal, support only limited precision.

SCOPE AND TOLL RULES

Full-district residents are included, even where part of the district lies outside the study region. Usual commute frequency, routes, parking, exemptions and current behavior are unknown. Through-zone travel with both endpoints outside, non-work trips and deliveries during work are excluded. These are potential commute exposures, not actual bills.

SOURCES & REPRODUCTION

- CTPP flows, residence tables and metadata
- Census district and block geography
- Census LODES primary jobs, 2021
